

Using IndySoap with WebBroker

This simple example shows how to use IndySoap with WebBroker applications.
It's really very simple

- Create a web server application.
- On the data module, put a TIdSoapWebBroker.
- Configure the TIdSoapWebBroker component as explained in the KeyServer tutorial
- Add a TIdSoapWebBrokerWSDL component..
- Point the server property of the TIdSoapWebBrokerWSDL at the TIdSoapWebBroker component.

This is all you need to do. You can have as many pairs of TIdSoapWebBroker and TIdSoapWebBrokerWSDL as you like. You don't need to have a WSDL component, but if you don't then the service won't be published through a WSDL. Obviously, each different component must have a unique path name

As a freebie, this tutorial also includes code that shows how to use Indy to host a stand alone web broker application
